

ANIMALS VS HUMANS

Humans are the only living beings on earth who have the freedom to make decisions for themselves. Animals do not enjoy such liberty. Animals live in a food chain, while humans do not follow any particular chain.

Humans are omnivorous beings, i.e., they can eat both vegetarian and non-vegetarian foods. Animals can be carnivorous, herbivorous, or omnivorous. Animals like lions and tigers are carnivorous (survival on meat). Animals like cows, sheep are herbivorous (survival on grass), and animals like bears, cockroaches are omnivorous (survival on both vegetarian and non-vegetarian foods).

The weight of a human brain is 1.2 Kgs. The size of the brain varies to the size of an animal. For instance, the brain of a blue whale weighs 6.90 Kg, while the brain size of an earthworm weighs 170-180 micrometers.

Humans have the ability to reason upon certain things, and are driven by instincts, intellect, and logic. Animals cannot reason, but they are only driven by their instincts.

Humans walk on 2 legs whereas animals walk on 4.

Humans have the ability to turn any kind of environment according to themselves. Animals are incapable of changing the environment. Therefore, they can either adapt to the environment or die.

Humans have a particular language to express themselves to each other. On the other hand, animals converse with each other, but they do not have a particular language to converse in, they lack the expressiveness of a human language.

Humans have various ways of survival and sustenance. Animals are only dependent upon nature. So, they do not have any other means of survival.
